**Title** TRAPT: A multi-stage fused deep learning framework for transcriptional regulators prediction via integrating large-scale epigenomic data

Maintainer Guorui Zhang <mp798378522@gmail.com>

**Description** TRAPT is a multi-omics integration framework designed for inferring transcriptional regulator activity from a set of query genes. TRAPT employs a multi-stage fusion strategy to address the issues of incomplete cisregulatory profile coverage and TRBP problems. By leveraging two-stage self-knowledge distillation to extract the activity embedding of regulatory elements, TRAPT can predicts key regulatory factors for sets of query genes through a fusion strategy.

2 CONTENTS

**CHAPTER** 

**ONE** 

### TRAPT.CALCSAMPLERPMATRIX MODULE

TRAPT.CalcSampleRPMatrix.dhs2gene(args, sample)

Calculate the Epi regulatory potential score.

#### **Parameters**

- **args** argparse.Namespace Global parameters.
- **sample** str Epi sample name.
- **vec** np.array Epi PRE score.

#### Returns

Epi sample name, and Epi-RP score.

### TRAPT.CALCTRAUC MODULE

```
class TRAPT.CalcTRAUC.CalcTRAUC(args, RP_Matrix_TR_Sample, w)
     Bases: object
     Calculate the area under the curve (AUC) for each TR curve.
     args
          Global parameters for TRAPT.
               Type
                   TRAPT.Tools.Args
     RP_Matrix_TR_Sample
          The sum of TR-RP scores and D-RP scores.
               Type
                   anndata.AnnData
          U-RP scores.
               Type
                   np.array
     Notes
     The input is the RP matrix, and the calculation is performed as follows:
                                        IRP = (TRRP + DRP) \times URP
     static get_auc(params)
          Parallel computing module.
          Parameters: i: int
               The i-th row of the I-RP matrix.
          j
               [int] Default is 0.
          labels
               [np.array] Gene vector.
               [np.array] I-RP vector.
```

#### Returns

i, j, and the AUC score of the i-th TR.

#### iter\_params(gene\_vec, trunk)

Parallel parameter module.

Parameters: gene\_vec : np.array

Gene vector.

#### trunk

[int] Number of blocks.

#### Returns

An iterator.

#### run()

TR auc calculation module execution entry point.

#### Returns

A pd.DataFrame of AUC scores for TRs.

**CHAPTER** 

### **THREE**

### TRAPT.CALCTRRPMATRIX MODULE

#### TRAPT.CalcTRRPMatrix.dhs2gene(params)

Calculate the TR regulatory potential score.

#### **Parameters**

- **args** argparse.Namespace Global parameters.
- **sample** str TR sample name.
- **vec** np.array TR PRE score.

#### Returns

TR sample name, and TR-RP score.

TRAPT.CalcTRRPMatrix.str2bool(v)

### TRAPT.CALCTRSAMPLERPMATRIX MODULE

```
class TRAPT.CalcTRSampleRPMatrix.CalcTRSampleRPMatrix(library='library', output='library',
                                                                type='H3K27ac')
     Bases: object
     The D-RP model network aggregation module.
     library
          Path to the background library.
              Type
                  str
     output
          Output path, default is 'library'.
              Type
                  str
     type
          H3K27ac/ATAC.
              Type
                  str
     run()
          D-RP model network aggregation module execution entry point.
```

#### TRAPT.DLFS MODULE

class TRAPT.DLFS.CustomSigmoid(\*args, \*\*kwargs)

Bases: Layer call(x)

This is where the layer's logic lives.

The *call()* method may not create state (except in its first invocation, wrapping the creation of variables or other resources in *tf.init\_scope()*). It is recommended to create state, including *tf.Variable* instances and nested *Layer* instances,

in \_\_init\_\_(), or in the build() method that is

called automatically before call() executes for the first time.

#### **Parameters**

• **inputs** – Input tensor, or dict/list/tuple of input tensors. The first positional *inputs* argument is subject to special rules: - *inputs* must be explicitly passed. A layer cannot have zero

arguments, and *inputs* cannot be provided via the default value of a keyword argument.

- NumPy array or Python scalar values in *inputs* get cast as tensors.
- Keras mask metadata is only collected from *inputs*.
- Layers are built (build(input shape) method) using shape info from inputs only.
- input spec compatibility is only checked against inputs.
- Mixed precision input casting is only applied to *inputs*. If a layer has tensor arguments in \*args or \*\*kwargs, their casting behavior in mixed precision should be handled manually.
- The SavedModel input specification is generated using *inputs* only.
- Integration with various ecosystem packages like TFMOT, TFLite, TF.js, etc is only supported for *inputs* and not for tensors in positional and keyword arguments.
- \*args Additional positional arguments. May contain tensors, although this is not recommended, for the reasons above.
- \*\*kwargs Additional keyword arguments. May contain tensors, although this is not recommended, for the reasons above. The following optional keyword arguments are reserved: training: Boolean scalar tensor of Python boolean indicating

whether the *call* is meant for training or inference.

mask: Boolean input mask. If the layer's call() method takes a mask argument, its default value will be set to the mask generated for inputs by the previous layer (if input did come from a layer that generated a corresponding mask, i.e. if it came from a Keras layer with masking support).

#### Returns

A tensor or list/tuple of tensors.

```
class TRAPT.DLFS.FeatureSelection(args, data_ad, type)
     Bases: object
     TSFS(X, T)
           Teacher-Student Feature Selection.
           Parameters: X : np.array
               Epi-RP matrix.
           T
               [str] Input genes vector.
               Returns
                   Index values sorted by Epi sample weights, and Epi sample weights.
     get_act(t=1)
           U-RP teacher model activation function.
           Parameters: t: float
               Temperature value.
     get_corr(v1, v2)
           Correlation calculation.
     get_loss()
           U-RP teacher model loss function.
     run()
           U-RP model execution entry point.
               Returns
                   A pd.DataFrame of U-RP scores for query Genes, and selected sample information.
     sort_by_group(vec)
           Grouping function.
     train(X, y)
           U-RP model training entry function.
           Parameters: X: np.array
               Epi-RP matrix.
           y
               [str] Input genes vector.
               Returns
                   U-RP model.
```

#### class TRAPT.DLFS.SparseGroupLasso(l1=0.01, l2=0.01, groups=None)

Bases: Regularizer

#### get\_config()

Returns the config of the regularizer.

An regularizer config is a Python dictionary (serializable) containing all configuration parameters of the regularizer. The same regularizer can be reinstantiated later (without any saved state) from this configuration.

This method is optional if you are just training and executing models, exporting to and from SavedModels, or using weight checkpoints.

This method is required for Keras *model\_to\_estimator*, saving and loading models to HDF5 formats, Keras model cloning, some visualization utilities, and exporting models to and from JSON.

#### Returns

Python dictionary.

TRAPT.DLFS.seed\_tensorflow(seed=2023)

### TRAPT.DLVGAE MODULE

```
Defines the computation performed at every call.
           Should be overridden by all subclasses.
           Note: Although the recipe for forward pass needs to be defined within this function, one should call the
           Module instance afterwards instead of this since the former takes care of running the registered hooks while
           the latter silently ignores them.
     kl_div()
     predict_h(x)
     reparametrize(mu, logstd)
               Return type
                   Tensor
     training: bool
class TRAPT.DLVGAE.CalcSTM(RP_Matrix, type, checkpoint_path, device='cuda')
     Bases: object
     D-RP model network reconstruction module.
     Parameters: RP_Matrix: TRAPT.Tools.RP_Matrix
           TR-RP matrix and Epi-RP matrix.
```

class TRAPT.DLVGAE.CVAE(input\_dim, condition\_dim, h\_dim, z\_dim)

Bases: Module
forward(x)

type

device

[str] Epi-RP type.

[str] Model save path.

[str, optional] cpu/cuda.

static get\_cos\_similar\_matrix(m1, m2)

Matrix cosine similarity calculation.

checkpoint\_path

```
get_edge_index(A, B, n=10)
          Construct a heterogeneous network.
          Parameters: A: anndata.AnnData
               TR-RP matrix.
          В
               [anndata.AnnData] Epi-RP matrix.
          n
               [int] Number of nearest neighbors for TR.
               Returns
                   TR-Epi heterogeneous network.
     init_cvae()
          D-RP teacher model training function.
     init_vgae(h, use_kd)
          D-RP student model training function.
          Parameters: h: torch.Tensor
               Potential representation of the D-RP teacher model.
          use_kd
               [bool] Utilize knowledge distillation.
     recon_loss(z, data, norm, weight)
          Variational Gaussian Autoencoder (VGAE) reconstruction loss.
     run(use_kd=True)
          D-RP model network reconstruction module execution entry point.
     save_graph()
     static sparse_to_tensor(data, type='sparse')
class TRAPT.DLVGAE.InnerProductDecoderWeight(A_e, *args, **kwargs)
     Bases: InnerProductDecoder
     forward(z, edge_index=None, sigmoid=True)
          Decodes the latent variables z into edge probabilities for the given node-pairs edge_index.
               Parameters
                   • z (torch. Tensor) – The latent space Z.
                   • sigmoid (bool, optional) - If set to False, does not apply the logistic sigmoid func-
                     tion to the output. (default: True)
               Return type
                   Tensor
     training: bool
class TRAPT.DLVGAE.VariationalGCNEncoder(in channels, h dim, z dim)
     Bases: Module
```

forward(x, edge\_index)

Defines the computation performed at every call.

Should be overridden by all subclasses.

**Note:** Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

predict\_h(x, edge\_index)

training: bool

TRAPT.DLVGAE.seed\_torch(seed=2023)

#### **CHAPTER**

### **SEVEN**

### **TRAPT.RUN MODULE**

TRAPT.Run.main()

TRAPT method entry function.

TRAPT.Run.runTRAPT(args)

TRAPT execution entry function.

TRAPT.Run.args

Global parameters for TRAPT.

**Type** 

TRAPT.Tools.Args

TRAPT.Run.Returns

A pd.DataFrame of TR activity.

TRAPT.Run.str2bool(v)

### **EIGHT**

### TRAPT.TOOLS MODULE

```
class TRAPT.Tools.Args(input, output, library='library', threads=16, trunk_size=32768,
                            background_genes=6000, use_kd=True, tr_type='all', source='all')
      Bases: object
      TRAPT Global Parameters.
      input
           Input path for the gene set.
               Type
                   str
     output
           Output path for TRAPT results.
               Type
                   str
     library
           Path to the background library, default is the 'library' path in the current directory.
               Type
                   str, optional
      threads
           Number of processes used for TRAPT inference.
               Type
                   int, optional
      trunk_size
           Size of the chunks.
               Type
                   int, optional
     background_genes
           Number of background genes selected.
               Type
                   str, optional
     use_kd
           Use knowledge distillation.
               Type
```

str, optional

```
tr_type
          all/tf/tcof/cr.
              Type
                  str, optional
     source
          all/cistrome/chip\_altas/gtrd/remap/chip-atlas/remap/encode/geo.
              Type
                  str, optional
class TRAPT.Tools.RPMatrix(library, name, to_array=True)
     Bases: object
